## Introduction

In this laboratory you will have a statement and you have to solve it using R, Rmarkdown and LaTeX.

All the necessary formulas will be written in LaTeX. And the answers will be written using the R and Rmarkdown commands required. (*FORMULA = OUTPUT FROM CODE*)

You have to follow the index given and add the explanations required.

## The statement

An industrial engineer has designed a machine to pack three-pound potato bags. However, due to various reasons, such as different weights of potatoes, filling problems, etc. is aware that the final weight of the potato bag won't be exactly three kilos, but there will be random variations in this quantity.

## Read the data and describe them

1. The data of the sample comes in the following file: *potato\_bags.csv*

### QUESTIONS

How many data are in the file?

How many variables?

2. Find the mean, variance, standard deviation of the data in the sample

The mean of the sample is  $\bar{x} = \text{FORMULA} = \text{OUTPUT FROM CODE}$ ,

the variance is  $\sigma^2 = \text{FORMULA} = \text{OUTPUT FROM CODE}$ ,

and the standard deviation is  $\sigma = \text{FORMULA} = \text{OUTPUT FROM CODE}$ .

3. Draw the histogram of the data showing the density not the frequencies.

## Sampling distribution of the Sample Mean $X_n$

Find the expected value of the Sample Mean and its standard error.

$$E[X_n] = \text{FORMULA} = \text{OUTPUT FROM CODE}$$

$$\text{and standard error } SD(X_n) = \text{FORMULA} = \text{OUTPUT FROM CODE}$$

Which distribution follows the Sample Mean and why?

**ANSWER:**

>

Draw the curve supposing the original population has mean  $\mu = 3$  and  $\sigma = 0.2$ .

## Confidence interval for the mean

1. Which distribution do you use for finding the probability of the confidence interval? Write the formula for the scores.

**ANSWER:**

*score = FORMULA*

2. Find the corresponding quantiles using that distribution.

**ANSWER:**

The value of the quantile corresponding to the significance level is  $q = \text{OUTPUT FROM CODE}$

3. And draw it in the graphic of the distribution.

3. Find the margin of error and the bounds of the interval.

**ANSWER:**

The margin of error is *OUTPUT FROM CODE*

The bounds of the interval for the mean: (*OUTPUT FROM CODE*)

## Test the following hypothesis

To check if the machine is well calibrated, take a sample of 45 bags filled with potatoes and count their weight. With this information,

Does the engineer have reason to think the machine is poorly calibrated? (Please use 5% signication level).

## Design the test

Define the null hypothesis and the alternative hypothesis

The null hypothesis is ...

The alternative hypothesis is ...

The significance level is ...

## Find the corresponding statistic to the sample

The statistic follows the ....

The value of the corresponding statistic is ..*FORMULA = OUTPUT FROM CODE*

## Find the critical value corresponding to the significance level

The critical value is ..*OUTPUT FROM CODE*

## Find the p-value

The p-value is ... *FORMULA = OUTPUT FROM CODE*

## Make the decision

I reject/accept the null hypothesis because the ..

## Type of errors

The value of Type I error is ... *FORMULA = OUTPUT FROM CODE*

The value of Type II error is ... *FORMULA = OUTPUT FROM CODE*

## List of R commands

Write here a list of the R commands you have used

## Bibliography

In case you have used any write it here.
